* IARC Monographs on the Evaluation of the Carcinogenic Risk of Chemicals to Humans (volume 42, 1987) concludes that there is sufficient for the carcinogenicity of crystalline silica to experimental animals, and there is limited evidence of the carcinogenicity of crystalline silica to humans.

+ There are extremely small, but detectable amounts of substances regulated under California's Safe Drinking water and Toxic Enforcement Act (Proposition 65)
  
  - Arsenic – less than 2 ppm
  - Cadmium – less than 2 ppm
  - Chromium (VI) – less than 0.1 ppm
  - Lead – less than 4 ppm

  These levels are "typical" quantities and may change slightly with different lost. The term "less than" indicates that the Dolomite limestone contains crystalline silica at levels about 0.1% but less than 1%
